Masgutova Neurosensorimotor Reflex Integration (MNRI®)
www.masgutovamethod.com

International trainer, Suzanne Amanor-Wilks presents 3 different workshops *

* Workshop 1 (No pre-requisite - open to all):
MNRI® Reflex Integration: Maximizing Brain Potential
CPD accreditation applied for

Cape Town: 21-22 March 2020

Learning, planning, and the development of inner control are some of the most important functions of the brain’s cortex. Successful development of these skills ultimately depends upon the physiological maturation of the brainstem through early movements, reflex patterns and sensory motor integration. Movement, behavioural and learning challenges often result when reflex patterns do not develop properly, are immature, and/or are poorly integrated in comparison with typical patterns of development. In addition, primary reflex patterns may not function appropriately following significant life stressors and/or trauma that children and adults may experience. It has been found that as the number of non-integrated primary motor reflex patterns in neurotypical children increase, the number and severity of learning challenges correspondingly increases. This 2-day course explores the MNRI® Reflex Integration Method and the role reflexes play in developing higher order cognitive functions, including focus, long-term memory, rational thinking, planning, academic learning, choice and decision-making. You will also learn MNRI® techniques for integrating certain reflexes and take a look at Hands on activities to incorporate course content into daily school, clinic and home practice so as to move closer to reaching optimal learning potential, as well as social and emotional growth.

This course is relevant to:
Teachers/Educators, Facilitators, Parents, Speech Language Pathologists, Occupational Therapists, Physiotherapists, Health Care Provider Assistants, Psychologists, Counsellors, Massage Therapists, Nurses and other Health Care Providers
